Experience the difference™

GentleCath™ Hydrophilic Catheters
Help minimize the risk of infection with no-touch catheterization
Getting Started

We understand that right now you might be going through a challenging time, entering a whole new phase in life. We are here to make the transition as smooth as possible, and to provide information and tips to help you move forward successfully!

We want you to experience the difference ConvaTec can make. With a long history of continence care, we can give you the support you need, whenever you need it. We’re just a phone call away and always happy to answer any question you might have. Simply call the ConvaTec Customer Interaction Center toll free at 1-800-422-8811 and one of our Wound, Ostomy Continence nurses will help you.

You probably received a lot of information from your healthcare provider, but we want to make sure you have all the important things in one place. In this booklet you will find information about how to use intermittent catheters, tips and troubleshooting and much more.

What is intermittent catheterization?

Intermittent catheterization means periodic insertion of a hollow plastic tube (a catheter) into the bladder to drain urine from the bladder.

Catheterization is done when the bladder is full, if you are unable to pass urine or after incomplete voiding to drain residual urine in the bladder.

Catheterization and your body

The bladder needs to be emptied 4-8 times a day (based on your fluid intake). The catheter is inserted into the urinary meatus (the little opening of the urethra where urine comes out) and then travels through the urethra to the bladder. Once the catheter is in the bladder it can drain the urine.

The advantages

- Catheterization prevents the bladder from over filling
- It eliminates residual urine
- It helps prevent bladder infections
- It gives you independence
Hydrophilic catheters are coated with a hydrophilic polymer that reacts with water to create a smooth, slippery coating on the surface of the catheter. Compared to uncoated catheters, hydrophilic catheters have been shown to reduce the incidence of urinary tract infections.¹

Help minimize the risk of infection with no-touch catheterization

- GentleCath™ Hydrophilic catheters feature a no-touch handling strip which allows the user to catheterize without touching the catheter
- This no-touch catheterization is designed to help minimize the risk of infection

What you need...

Before you begin, gather the following items: catheter, water-based lubricant, washcloth or antiseptic wipe and a receptacle to void into if a toilet is not available.

Wash your hands thoroughly and then choose the position that is most comfortable for you. Move your pelvis forward as much as possible to get a better view. You may want to use a hand mirror at first so you can see everything and get an idea of insertion placement.

When the bladder is empty withdraw the catheter slowly. Discard catheter after use. Wash your hands.
Troubleshooting & frequently asked questions

How often should I empty my bladder?

- Usually, first thing in the morning, last thing at night and about 2-3 times during the day.
- When you have the urge to urinate or your bladder contains 10-18 fl oz (300-500 mL) of urine.
- Check the amount when you empty your bladder to see that the bladder is not holding more than 18 fl oz (500 mL). If it is, you will need to catheterize more often.
- Whenever your doctor recommends.
- To help you keep track of your fluid intake and output, it might be helpful to make a daily chart like this:

<table>
<thead>
<tr>
<th>TIME</th>
<th>Monday</th>
<th>Tuesday</th>
<th>Wednesday</th>
<th>Thursday</th>
<th>Friday</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Drink</td>
<td>Void: fl oz/mL</td>

</tbody>
</table>

I’m having trouble inserting, or removing, the catheter...

- You may feel some resistance when inserting or removing the catheter. If this happens, wait momentarily and take a few deep breaths until the sphincter muscle relaxes.
- Never force the catheter, neither when inserting nor upon removal.
- If you have trouble removing the catheter - don’t panic! Relax and take some deep breaths - perhaps a little cough to relax the muscles as you remove it.
- Contact your health care provider immediately if you cannot get the catheter out.

No urine is draining...

- Check the eyelets at the tip of the catheter to make sure they are not blocked.
- Ensure the catheter is inserted far enough into the bladder.
- Pull the catheter back a short distance.
- If you are unable to drain for over 6-8 hours contact your healthcare provider.

How do I use a catheter when I am menstruating?

- You can catheterize as normal. It is even more important at this time to maintain meticulous hand hygiene to prevent accidental contamination of your catheter.

How do I use a catheter during pregnancy?

- In the early stages of pregnancy you can catheterize just as you do normally. As your body changes you may need a longer catheter. Consult your healthcare provider for advice.

What about intimacy?

- You should be able to have sexual relations as before. Prior to sexual activity you may want to catheterize to ensure your own comfort and prevent the possibility of urine leakage. It is important to wash your genital area after sexual activity.

How do I obtain supplies?

- There are several retailers who will ship supplies right to your home. Call the ConvaTec Interaction Center for more information 1-800-422-8811 (Mon-Fri 8:30am-7:00 pm EST), go to www.convatec.com or email at CIC@convatec.com.
How can I avoid UTI’s?

Urine is normally sterile and the normal flow of urine usually prevents bacteria from growing in the urinary tract. When urine stays in the bladder, however, bacteria have a chance to grow and infect the urinary tract.

You can help reduce the risk of UTI’s in several ways.

• **Wash your hands thoroughly:** Hand washing and personal hygiene before and after you use a catheter are very important.
• **Drink enough fluids:** Try to drink at least 8-10 cups of fluids daily.
• **Use a catheter regularly:** Regular elimination of urine is important to help reduce the infection risk.

**Avoid touching the sterile catheter:** No-touch catheterization can help reduce the risk of infection.

How will I know if there may be an infection?

• Fever
• Pain or a burning feeling when passing the catheter or urine
• Cloudy, oddly-colored or offensive-smelling urine
• The need to empty the bladder more often than usual
• Leakage between catheterizations
• Kidney pain

Contact your healthcare provider if you experience any of these symptoms.

Medicare guidelines

Many people have questions about Medicare Guidelines regarding Urinary Catheter Supplies. At ConvaTec, we want to give you the most up-to-date information possible.

**Medicare: at-a-glance**

Per the Medicare guidelines on Intermittent Urinary Catheterization, any patient who utilizes intermittent catheters can receive one sterile urological catheter and one packet of lubricant for each catheterization.

• Physician prescriptions should reflect the actual number of times a patient catheterizes per day.
• Medicare will cover one catheter per cathing episode up to a maximum of 200 intermittent catheters per month:
  • **A4351:** Intermittent urinary catheter with straight tip
  • **A4352:** Intermittent urinary catheter with Coudé/Tiemann tip
  When a coudé tip catheter (A4352) is used there must be documentation in your medical record stating why the patient cannot use a straight tip catheter.
  • **A4353:** Intermittent urinary catheter, with insertion supplies
  With qualifying documentation in your medical record stating why the patient needs this.

**Medicare’s policy is designed to:**

• Promote safety
• Reduce health care costs related to urinary tract infections
• Improve your quality of life
• Reduce risk of infection
